Hedge funds in 2023: How has the environment changed?

# Executive summary

For those clients who are comfortable embracing the complexity of hedge funds, we continue to believe that these strategies can play an important role in institutional portfolios and deserve a seat at the table. Furthermore, the justifications for these strategies may be strengthening as we enter a much different market regime.

This annotated paper covers the current market environment and what this may suggest for the hedge fund opportunity set going forward (see **Beta impact** and **Alpha opportunity** slides). Then, we present two effective methods of hedge fund implementation and the characteristics of each (see **Implementation**).

Evolving market conditions suggest that hedge funds will be more competitive relative to traditional market returns over the next 5-7 years, and investors would be well advised to consider whether they can have a role in their portfolios.

Senior Associate Director | Hedge Funds

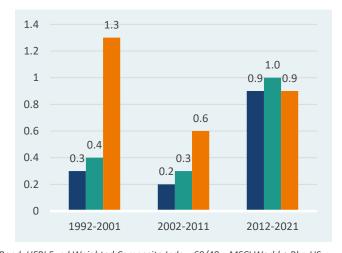

# A changing market environment

- The previous 10 years leading up to the current interest rate cycle were tremendous for equities and traditional portfolios on both a *cαsh plus* basis and compared to their history. Hedge funds performed fine during this time, remaining a valuable option at the total portfolio level.
- This period was marked by unprecedented central bank intervention, supportive fiscal policy, ongoing globalization and subdued geopolitical risk, and a post-Global Financial Crisis rebound.
  - Following the COVID-19 pandemic, the market experienced massive monetary easing and fiscal stimulation. Tailwinds became headwinds in the face of high inflation, high interest rates, geopolitical risk/war, and deglobalization trends.
- The magnitude and duration of their effects on markets remain unknown. Even if we assume a neutral effect from two key variables interest rates and inflation we can fairly conclude that the biggest tailwinds to markets from the last decade are gone in the shorter term, even though over a 10-year basis, expected capital market returns increased modestly over the expectations from the previous year.

# Looking forward: Beta impact

- The Beta factor is straightforward: headwinds for markets are generally headwinds for hedge funds in terms of total return.
- Given the low beta of hedge funds, there is great opportunity to outperform markets during market drawdowns.
- The duration of any negative equity market environments is also relevant: short-term shocks (Lehman, COVID to some extent) can also be painful for hedge funds as liquidity is rapidly pulled out of the market.
- However, intermediate- to longer-term drawdowns (or even flat market performance)
  allow hedge fund positioning to adapt and take advantage of directional trends or for
  market neutral arbitrage strategies to stack up and compound returns even as markets
  remain subdued.

For the Beta component, any headwinds for markets are generally headwinds for hedge funds, which, viewed in aggregate, have a low but consistent equity beta of 0.3-0.4.

# Looking forward: Alpha opportunity

We believe that some of the headwinds for markets are actually tailwinds for the opportunity set used by hedge funds to extract absolute returns. A few examples:

- 1. Corporate Stress and Dispersion: High borrowing costs, slowing growth, and withdrawal of liquidity from the financial system should lead to increasing corporate stress. The transition towards real consequences for poorly run companies should present opportunities for actively managed strategies such as hedge funds.
- 2. Inflation and Central Bank Action: The years following the GFC were challenging for global macro strategies as central banks kept interest rates at zero almost indefinitely (see Exhibit 4). The world has changed since then. Macro traders have demonstrated their value by predicting central bank actions better than markets (which, of course, is not possible when central banks are not doing anything). (see Exhibit 5)
- 3. Cash: Cash return levels do impact total returns. Any hedge fund using leverage or shorting (which is most of them) now earn significant yields on any cash balances. Heavy options-based strategies, such as Macro, are seeing option premium offset by cash yields. Spread-based arbitrage strategies should see a proportionate increase in spreads, and short interest carry for long/short equity funds is now a meaningful contributor for the first time since before the GFC.
- 4. Volatility and Tail Risks: Downside risks may remain elevated in the near-term for well-accepted reasons: real economic risk exists while equity and credit markets appear to be pricing a perfect resolution to the inflation issue. Additionally, the diversification power of bonds may not be as reliable amid recent Federal Reserve dynamics. Given all these, we believe hedge funds may be a more effective tool to diversify risky assets in this environment.

# Implementation

We continue to stand by our philosophy that *hedge funds are not an asset class*, and that the variability between strategy types and the individual funds within those strategies is enormous.

There are many exotic roles that hedge funds can play in today's institutional investor universe: tail risk, opportunistic, downside protection, and more. The two roles we believe will be most impactful going forward are what we call **Absolute Return** and **Inclusion**.

### **Absolute Return**

- This is a modification of the traditional "asset class" or single line-item hedge fund approach and, as such, requires some policy treatment as a distinct allocation separate from other asset classes.
- Each investor should work to define the objectives of their hedge fund approach clearly. Objectives may include portfolio diversification or simply a cash-plus return target.
- Portfolio objectives and constraints are different for each client, but our starting point for reasonable risk and return targets ends up at around 4-5% over cash returns with a beta to equity and credit markets of 0.3 or less and a correlation of 0.6 or less over a full market cycle. Portfolios should be diversified across as many alpha sources as possible using the most capable managers to consistently achieve these objectives.

# Implementation (cont'd)

### **Inclusion**

- The Inclusion approach involves investing in, benchmarking, and thinking about, hedge fund investments in line with the asset class in which they are trading.
- With this approach, the investable universe comprises funds that primarily invest in equity or credit securities and produce returns that consistently include some beta and some alpha.
  - In equity, the hedge fund investment thesis puts great emphasis on the extension of active management skill relative to traditional long-only funds. We expect that shorting will be a particularly valuable talent in this new environment as the impact of higher rates drives dispersion between winners and losers across the market.
  - In credit, we believe the *extension of active management* still applies but is augmented by an even wider and more complex universe of public and private securities, offering even more paths to outperformance. Again, with the Inclusion approach, the goal is to outperform traditional credit and fixed income benchmarks, not peer composites. And because these strategies can apply a high degree of skill in an even broader universe, we find that credit hedge funds can offer both significant diversification impacts *and* return enhancement.

We believe that both Absolute Return and Inclusion allocations should be considered as a long-term, strategic part of portfolios, and not as a source of liquidity unless absolutely necessary. In our view, manager selection is the ultimate determinant of success, and investors should take great strides to preserve or obtain capacity in top funds.

# Conclusion

- In this research paper, we reviewed:
  - The market environment of the past decade and its impact on hedge fund behavior.
  - The current market environment and what this may suggest for the hedge fund opportunity set going forward.
  - Two effective methods of hedge fund implementation and the characteristics of each.
- Evolving market conditions suggest that overall hedge funds will be much more competitive relative to traditional market returns over the next 5-7 years. Investors who do not currently use hedge funds should consider the benefits in the new market environment, and those already invested may use this opportunity to refine their scope and objectives and increase allocations as appropriate.
